

Data Type Ranges

Article • 06/14/2024

The Microsoft C++ 32-bit and 64-bit compilers recognize the types in the table later in this article.

C++

- `int` (`unsigned int`)
- `__int8` (`unsigned __int8`)
- `__int16` (`unsigned __int16`)
- `__int32` (`unsigned __int32`)
- `__int64` (`unsigned __int64`)
- `short` (`unsigned short`)
- `long` (`unsigned long`)
- `long long` (`unsigned long long`)

If its name begins with two underscores (`__`), the data type is nonstandard.

The ranges specified in the following table are inclusive-inclusive.

 Expand table

Type Name	Bytes	Other Names	Range of Values
<code>int</code>	4	<code>signed</code>	-2,147,483,648 to 2,147,483,647
<code>unsigned int</code>	4	<code>unsigned</code>	0 to 4,294,967,295
<code>__int8</code>	1	<code>char</code>	-128 to 127
<code>unsigned __int8</code>	1	<code>unsigned char</code>	0 to 255
<code>__int16</code>	2	<code>short</code> , <code>short int</code> , <code>signed short int</code>	-32,768 to 32,767
<code>unsigned __int16</code>	2	<code>unsigned short</code> , <code>unsigned short int</code>	0 to 65,535
<code>__int32</code>	4	<code>signed</code> , <code>signed int</code> , <code>int</code>	-2,147,483,648 to 2,147,483,647
<code>unsigned __int32</code>	4	<code>unsigned</code> , <code>unsigned int</code>	0 to 4,294,967,295
<code>__int64</code>	8	<code>long long</code> , <code>signed long long</code>	-9,223,372,036,854,775,808 to 9,223,372,036,854,775,807

Type Name	Bytes	Other Names	Range of Values
<code>unsigned __int64</code>	8	<code>unsigned long long</code>	0 to 18,446,744,073,709,551,615
<code>bool</code>	1	none	<code>false</code> or <code>true</code>
<code>char</code>	1	none	-128 to 127 by default 0 to 255 when compiled by using <code>/J</code>
<code>signed char</code>	1	none	-128 to 127
<code>unsigned char</code>	1	none	0 to 255
<code>short</code>	2	<code>short int</code> , <code>signed short int</code>	-32,768 to 32,767
<code>unsigned short</code>	2	<code>unsigned short int</code>	0 to 65,535
<code>long</code>	4	<code>long int</code> , <code>signed long int</code>	-2,147,483,648 to 2,147,483,647
<code>unsigned long</code>	4	<code>unsigned long int</code>	0 to 4,294,967,295
<code>long long</code>	8	none (but equivalent to <code>__int64</code>)	-9,223,372,036,854,775,808 to 9,223,372,036,854,775,807
<code>unsigned long long</code>	8	none (but equivalent to <code>unsigned __int64</code>)	0 to 18,446,744,073,709,551,615
<code>enum</code>	varies	none	
<code>float</code>	4	none	3.4E +/- 38 (seven digits)
<code>double</code>	8	none	1.7E +/- 308 (fifteen digits)
<code>long double</code>	same as <code>double</code>	none	Same as <code>double</code>
<code>wchar_t</code>	2	<code>__wchar_t</code>	0 to 65,535

A variable of `__wchar_t` designates either a wide-character type or multibyte-character type. Use the `L` prefix before a character or string constant to designate the wide-character-type constant.

`signed` and `unsigned` are modifiers that you can use with any integral type except `bool`. Note that `char`, `signed char`, and `unsigned char` are three distinct types for the

purposes of mechanisms like overloading and templates.

The `int` and `unsigned int` types have a size of 4 bytes. However, portable code shouldn't depend on the size of `int` because the language standard allows this to be implementation-specific.

C/C++ in Visual Studio also supports sized integer types. For more information, see [__int8](#), [__int16](#), [__int32](#), [__int64](#) and [Integer Limits](#).

For more information about the restrictions of the sizes of each type, see [Built-in types](#).

The range of enumerated types varies depending on the language context and specified compiler flags. For more information, see [C Enumeration Declarations](#) and [Enumerations](#).
